

Module 6 Homework

Section 1: Creating a New AccountCode Climate was attempted first but no longer supports individual accounts. It requires a company email and organization details for enterprise use only. The verification email also never arrived. Navigating to a repository page returned a 404 error. After researching, I found that the Code Climate team rebuilt their individual code quality product as Qlty Software. Account creation on qlty.sh is done through GitHub OAuth. After authorizing the app, the platform prompts you to install the Qlty CLI and select a workspace.

What's your work email address? *

❗ Please enter a valid company email address.

What's your first name? *

What's your last name? *

The name of your organization: *

About how many engineers work at your organization? *

Code Climate is focused on helping large enterprises navigate the shift to AI-native software development. We combine software development data, context, and governance to equip leaders with the insights needed to accelerate the transformation.

☐ This is what I'm looking for. Let's chat!

☐ I'm looking for code quality tooling.

☐ I'm looking for a software engineering intelligence platform.

Section 2: Configuring the Tool

The Qlty CLI was installed on Windows via PowerShell and initialized in my Transaction-Pipeline repository using `qlty init`. Qlty scanned the project and auto-configured five plugins for Python: `trufflehog`, `radarlint-python`, `ripgrep`, `bandit`, and `ruff`. This generated a `.qlty/qlty.toml` config file committed to the repo, which controls which plugins run, file exclusion patterns, and thresholds. This same file is used by both the CLI and Qlty Cloud during PR analysis.

✓ Created qlty.toml config file with 5 plugins

<u>Plugin</u>	<u>Version</u>	<u>Targets</u>	<u>Config</u>
trufflehog	known_good	15 files	
radarlint-python	known_good	9 files	
ripgrep	known_good	9 files	
bandit	known_good	9 files	
ruff	known_good	9 files	

✓ Would you like to run plugins to see a sample of issues? · **yes**

› Running qlty.exe check --sample 5

AUTOFIXES: 1

```
file_cleaner.py:30
medium `datetime.datetime` imported but unused
25 25 | import os
26 26 | import pandas as pd
27 27 | import json
28   | import shutil
29   | import subprocess
30   | from datetime import datetime
   28 | import datetime import datetime
31 29 |
32 30 | def list_files_in_directory(directory):
33 31 |     """List all files in a directory and its subdirectories."""
ruff:F401
```

? Apply this fix? [Yes/no/all/none] › |

Section 3: Using the Tool to Review a Pull Request

I created a branch named qlty in my Transaction-Pipeline repository and opened a pull request into main. With the Qlty GitHub App installed, analysis triggered automatically. The build was completed in about 2 minutes.

Qlty detected 2 issues on the PR, both ruff:invalid-syntax errors on line 28 of file_cleaner.py. The broken line (imporrom datetime import datetime) was actually introduced by Qlty's own autofix during the local CLI run, which corrupted an import while trying to remove an unused one. The tool still correctly caught the problem in the PR review.

[Screenshot: Qlty build log]

The screenshot shows the GitHub interface for the 'Transaction-Pipeline' repository. The top navigation bar includes 'Overview', 'Issues', 'Metrics', 'Trends', 'Pulls', and 'Settings'. The 'Pulls' tab is active, showing a pull request titled 'issues from qlty #1' by 'AJ-Protzel'. The pull request is open and has a 'Build' button. The 'CODE QUALITY' section on the left shows 'Issues' with a count of 2. The main content area displays two identical Qlty issues. Each issue is titled 'ruff:invalid-syntax' and 'Simple statements must be separated by newlines or semicolons'. The code snippet shown in each issue is: '28 imporrom datetime import datetime' from the file 'file_cleaner.py'.

[Screenshot: Qlty PR issues tab showing 2 findings]

```
import os
import pandas as pd
import json
imporrom datetime import datetime

def list_files_in_directory(directory):
    """List all files in a directory and its subdirectories."""
    file_paths = []
    for root, dirs, files in os.walk(directory):
        for file in files:
            file_paths.append(os.path.join(root, file))
    return file_paths
```

[Screenshot: VS Code showing broken line 28]

Section 4: Reflections

Qlty's setup was fast and the GitHub integration works well. Getting from signup to automated PR review took under 15 minutes, and the plugin auto-detection saved time on configuration. The autofix feature was unreliable. It corrupted a line while trying to clean up an unused import, making the code worse. It should be used carefully. The original Code Climate was also a dead end for individual use, which wasn't obvious from the course materials. Overall Qlty is a useful tool for automated PR feedback. The security scanning from Bandit and Trufflehog adds value beyond basic linting, and I would use it on future projects.
